

Experimental Real-time Forecasting of Weather/Climate Conditions Potentially Favorable to COVID-19

** This product is experimental and addresses educational and research purposes only **

Forecasts initialized : 2020-05-10 Forecast Day 1: 2020-05-11

Augustin Vintzileos

Mohammad Sajadi

Fernando R. Miralles-Wilhelm

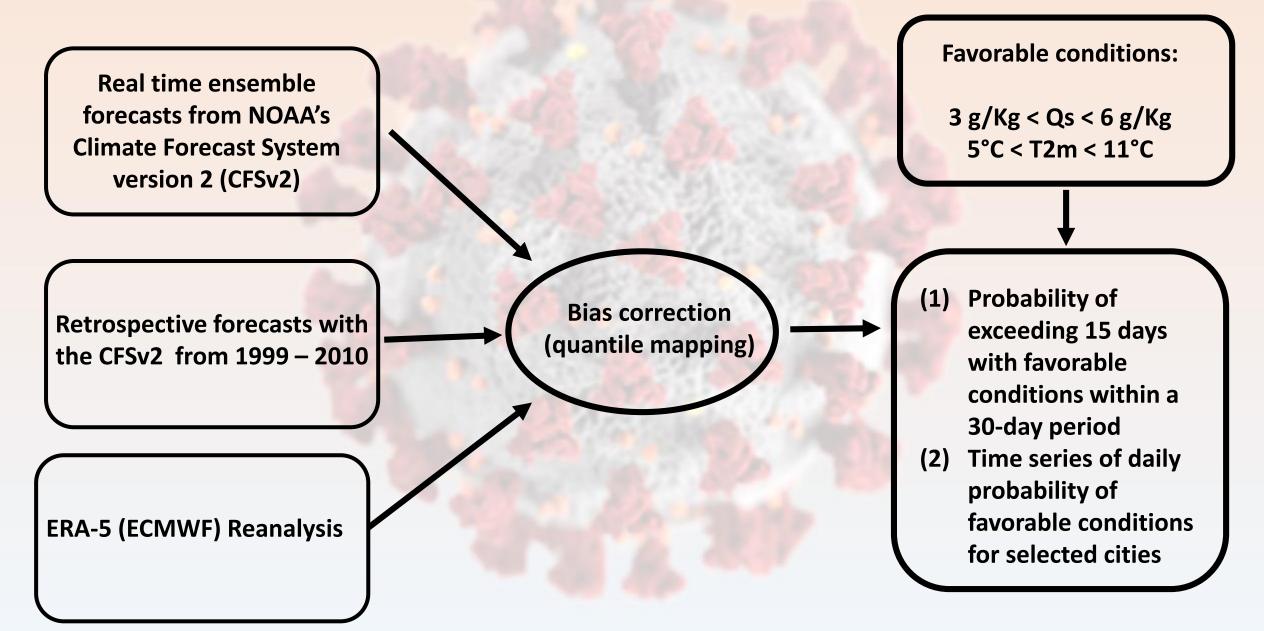

Objectives:

• Experimental forecasts of the combination of meteorological conditions favorable to SARS-CoV-2:

https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3550308

- We expect that these experimental forecasts will familiarize the health community with probabilistic forecasts of meteorological conditions relevant to the proliferation of the virus.
- These forecasts may also stimulate feedback from the health community that will help us refining the criteria of favorability e.g., laboratory experiments of virus life span as a function of temperature and humidity.
- We hope to initiate collaboration with epidemiological modelers in order to introduce meteorological drivers in early warning prediction systems.

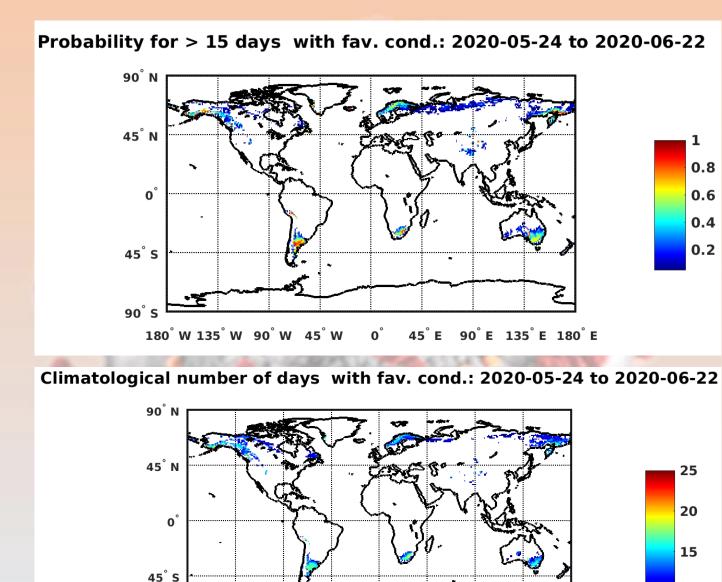

Methodology:

Forecast Section 1

A global view of favorable conditions:

What is the probability of exceeding 15 days of favorable conditions within given 30-day periods

0°

90[°] S

180°W 135°W 90°W 45°W

10

45[°]E 90[°]E 135[°]E 180[°]E

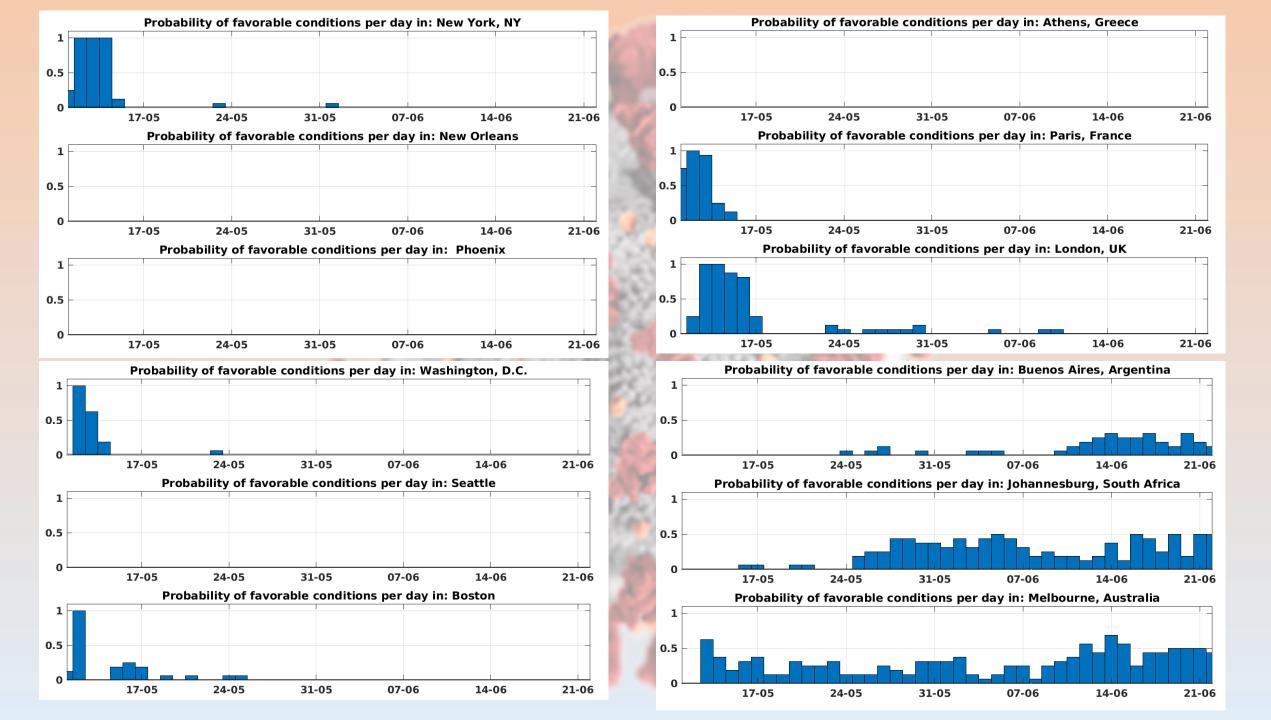

Favorable daily mean conditions:

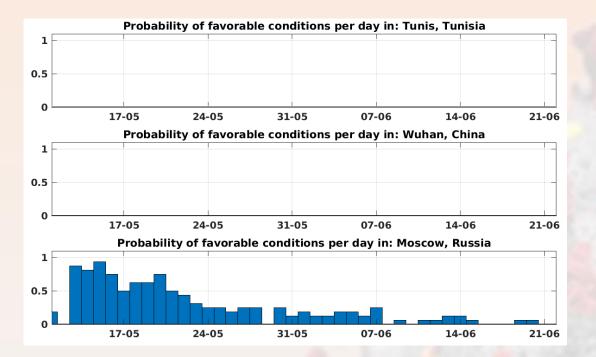

3 g/Kg < Qs < 6 g/Kg 5°C < T2m < 11°C

At this moment we are not accounting for the number of successive days with favorable or unfavorable conditions.

Forecast Section 2

Time series of the daily probability for favorable conditions for specific cities

Current and future work (pending funding):

- Refine definition of favorable atmospheric conditions as new data arrive
- Establish predictability of the combination of weather/climate conditions that are potentially favorable to SARS-CoV-2.
- Compute reliability and introduce relevant ensemble calibration techniques if necessary.
- Develop a seamless suite of products with downscaling where necessary:
